Software Engineer II | Samsara

Cover letter

Hi Samsara team,

What interests me about Vehicle Safety is that the software has to help people make a decision while they're busy doing something else. I learned the value of that running the NOC at Front Range Internet. Knowing a service was down wasn't enough; operators needed to see what had changed and what to check next. I built diagnostics for that handoff and also wrote and maintained web and billing software for the people using those systems.

I bring that same mindset to building products. On ProofMark I worked across a React signing interface, the APIs behind it, and the document state users depended on. At Technomancy IT I built a meeting-brief feature that uses a model to pull decisions and action items out of transcripts. I also connected tools through authenticated MCP integrations and kept a review step around AI output. Those are examples of what I've built in my practice, not a claim that I've shipped AI safety systems at fleet scale.

I'd like to bring that mix to Samsara: build the feature end to end, give the person using it enough context to judge the output, and leave the team with a way to see what failed and fix it.

Thanks,
Chad
